

Website Name: Murder Mystery Planner

I haven't been able to garner a strong understanding of everything we'll learn how to do in this class, and I'm a bit confused about the requirements for this assignment, but here is the idea I'm currently stewing on. I was thinking of making a sort of how-to-guide for planning a murder mystery party. I've planned one in the past, and I was planning on using the photos and documents I created for it as the data that I store. The site would provide the user with suggestions and advice on how to plan the party and create a storyline that appealed to their guests, while showcasing examples from the party that I planned. From what I gathered from Blackboard and discord, I think this should work, but please let me know if I need to change anything.

The "data" that I have is a collection of photo-shopped images, as well as fake news stories, text conversations, and the character ideas and storylines I came up with for my previous party. In order to allow the user to manipulate some of the data, I was thinking of making a feature that helps them create character profiles, and maybe something that outputs a plan for their party based on selections they make. If I need to focus on a simpler mechanic, I could also just allow them to pin specific ideas that they like so they can view all of their favorite concepts in one place.
